1 Assignment Overview & Requirements

Business Intelligence - EBUS3030
Assignment 2

Assignment Outcomes

This assignment requires multiple outputs to be created to exhibit your understanding of business intelligence/data analysis through an example 'real world' question that is comparable to what you may be asked of you as you become an IT professional.

Key outcomes to be delivered are: Data Modelling/ETL to get the data in a usable format, Output of your analysis, Report summarising your findings and a presentation to the class of your work. The presentation is expected to concentrate more on your findings/recommendations as if it were a situation where you are presenting the response to the CEO.

Assignment Question

The CEO of 'BIA Inc' had been speaking to the Sales Executive and had heard about some recent work you had completed and thought you might be able to assist them with a problem they have.

"I've heard that you helped the Sales Exec recently with understanding more about our Newcastle site. I would now like your help to get a handle on the whole business. As you are aware, the Newcastle office is just 1 of 10 sites we have across the country. Unfortunately, sales in some items have dropped across the country in recent years and we are currently running at a loss.

We need to consider consolidating our company offices. We need to reduce costs for the longevity of the company as a whole. I need you to get some numbers together around the performance of our 10 offices, so that I can factor this information into any decision regarding which office (or offices) we might consider closing.

I would like a summary of recent numbers and some trend analysis as well please. It would be great if you could also project sales for the next 12 months for each office as well. It would be helpful if you could indicate the 3 most popular and 3 least popular items in each of our stores, as well as the worst performing items for the company as a whole.

As you can imagine, this is a very sensitive topic so, as part of your response I want you to provide the justification as to which office we may close. Our decision will upset some people and I want to make sure we have all the background information on hand. If you can provide a Ranking of offices based on your analysis that would be wonderful.

…. I believe you started to bring together a data store of this information from the Newcastle Office, can you expand that and load all of the sales information for all offices and complete your analysis.
"

Assignment Deliverables

Using the data file provided in Excel and notes about the data (*Assignment 2 – data.xlsx*), you are required to complete the following elements as part of the assignment.

- Data Model/Data Load Process
  - Provide an overview of the data model & ETL process completed to get the data ready for analysis
  - Ensure you record any assumptions you have made as part of this component and your reasoning behind the assumption.
- Analysis including any predictive work undertaken
  - Provide the SQL and raw output of your base analysis
  - Provide workings of the predictive work you completed for the trending & prediction on future sales.
  - Ensure you record any assumptions you have made as part of this component and your reasoning behind the assumption (this includes answers to any relevant questions put to management (your lecturer) during workshops.

- Executive Summary & Presentation in response to business question.
    - Provide an Executive report and Dashboard
        - Your Executive report should include a short Executive brief/summary that presents a clear concise response back to the CEO question about possible downsizing of operations including evidence/justification.
        - A dashboard should allow quick comparisons between the sites to be undertaken as well as contain at least one element of 'predictive' analysis
        - Present the material as if it is to be consumed in a formal boardroom meeting
            - All members of the team need to participate in a (15 – 20 minute) presentation to be given as part of the lab in Week 11.
            - Please be aware that any of the company Executive may ask questions as you present your findings.

NB: As part of your response, you should also specifically include any assumptions/external information you have made/used throughout the process as well as any quality processes/checking you have completed or limitations you discovered.

Breakup of assignment Marks (total course mark for assignment = Assignment Part B submission (28% + Presentation Two (7%) = 35%.

Assignment Component	Percentage Allocation
Data Model/ETL	10%
Core Analysis	50%
Executive Summary/Evidence	25%
Dashboard	15%
	100%

Key Documents Required & Format

You are required to upload all files in a single zip file (including any presentation items for the team delivery within the lab) via blackboard to the Assignment Two drop folder by 12 noon, Thursday 25th October. You will also be required to submit a paper copy of your report at the beginning of the presentation workshop (make sure this is printed well before the workshop and has a group Assessment Cover sheet signed by ALL team members).

NB: Only 1 load per team only but it should contain all of the deliverable items.

Your data model should include a printout of an ER diagram using the notation described in lectures. It should also include a printout of your SQL schema showing Primary and foreign keys, as well as all attributes.

Your presentation is worth 7% of the course mark. It should simulate presenting the report to management. You should time your presentation to be between 12-15 minutes with 5-10 minutes for questions. You presentation should include a demonstration of your dashboard, results and recommendations from your analysis. Your presentation marks will contain components for organisation, comprehension of presented results, and timing.

2 Executive Summary

2.1 Datamart Business Rules

The following business rules were provided to be used in the context of this assignment:

- At BIA all customers interacts are in an online environment.We only support electronic orders.
- Returning Customers can provide POI information via the web interface and look up their record and that will flow with the sale
- The sales associate can complete the order form/sale for the client.
- Each sale will have a receipt number/id.
- A receipt can have many line items
- Each line item can only be for a single item, but the customer can purchase multiples of the same item.
- After consultation with your team, we have made the following change to discount applied to sales: Where a customer has multiple line items, any sale with 5 or more row items (containing at least 5 different items) is provided a 5% discount.
- The system automatically handles the total for the sale by looking up the item, then multiplying the costs per item by number purchased, and then should store this final field total as a record in the system (but should also be able to see clearly sales that were provided a discount.
- Store Item prices can change at any point, however the price the customer pays is the amount listed for the store item that is sold on the sale date. We need to keep a record of all store item prices historically so that we can determine what the store item price was at any particular past date.
- Only one BIA sales assistant can be attributed to any receipt.
- Customers may visit multiple stores for purchases (ie they are not locked to a particular store). As a result, all customer records are replicated across all stores, so they do not need to be re-recorded at a store by store level.

With these considerations in mind, the following report was created to outline the discovery, creation and polish to satisfy the assignment requirements.

3 Data Model

The following section outlines the models used in the design and creation of the database. It includes the EER Model with relations, attributes and relationships as well as the database schema from Microsoft SQL Server Management Studio.

3.0.1 Database Schema

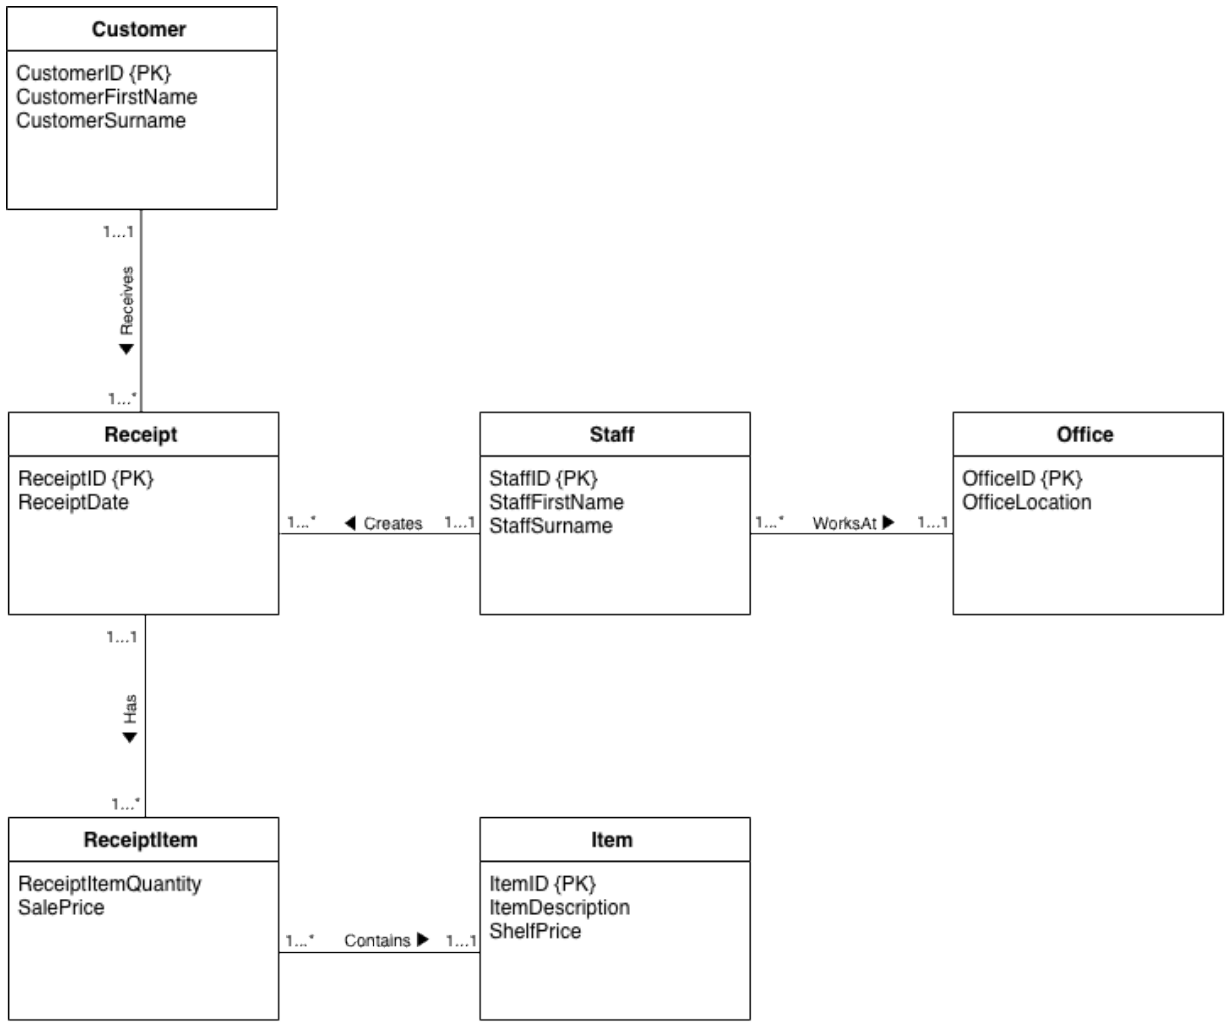
The below data model is only a suggestion and is still subject to change into the future. A full create script can be found in the appendix

It must be noted that the structure of this data model is less than efficient, and it would be expected in a datamart situation that only at lower levels of data would this schema remain responsive in the manner it is now, as the outline suggests the datamart is not necessarily the most suitable design for future use, however suits very well currently.

It would be expected that only at extremely large data sets would this model prove a bad design. In such cases a model more representative of the snowflake or star schema would be heavily advised.

3.0.2 EER Diagram

An EER diagram of the suggested data model is provided below.



4 Data Load Process (ETL/ELT)

Initial import of the data supplied in the xlsx file generated a very basic table that allowed us to analyze the data for potential outliers, confirm the business requirements of the data and then create tables from which the data model was derived.
The Imported table structure was as follows:

Assignment2Data

Column Name	Data Type	Allow Nulls
Sale_Date	datetime2(7)	☐
Reciept_Id	int	☐
Customer_ID	nvarchar(50)	☐
Customer_First_Name	nvarchar(50)	☐
Customer_Surname	nvarchar(50)	☐
Staff_ID	nvarchar(50)	☐
Staff_First_Name	nvarchar(50)	☐
Staff_Surname	nvarchar(50)	☐
Staff_office	int	☐
Office_Location	nvarchar(50)	☐
Reciept_Transaction_Row_ID	int	☐
Item_ID	int	☐
Item_Description	nvarchar(50)	☐
Item_Quantity	int	☐
Item_Price	float	☐
Row_Total	float	☐
		☐

A decision to leave this initial import table as default was made to allow easy reference to the initially supplied excel data file.

4.1 Quality Assurance Processes

After performing a basic query to determine if, like our previous project, multiple items of the same ID on a single receipt existed it was apparent that the same issue existed in this data set as did in the previous.
To mitigate this, the team developed a simple update to the ReceiptItem was performed, to ensure that a dicount would not be applied to a receipt with less than five items, when potentially the receipt did not actually have more than four distinct items. The following query was used to determine this information:

```
1  -- Verify that no receipt has duplicate ItemIds and all are unique per order
2  SELECT *
3  FROM
4  (
5      SELECT [ReceiptItem].[ReceiptId],
6      COUNT([ReceiptItem].[ReceiptId]) AS 'ItemCount',
7      COUNT(DISTINCT [ReceiptItem].[ItemId]) AS 'ItemIdCount'
8      FROM [ReceiptItem]
9      GROUP BY [ReceiptItem].[ReceiptId]) AS SubQuery
10 WHERE [SubQuery].[ItemIdCount] != [SubQuery].[ItemCount]
```

Returning no entries once the data was cleaned with a C# Script internally developed. This took into account not only checking for data integrity but generated new sql to facilitate item consolidation. These scripts have been listed in the appendices of this report.

4.2 Assumptions and Reasoning

The following section outlines our assumptions and the reasoning behind certain decisions made by the team at any stage of the project. The team will always try to apply business rules supplied by the firm to any of the decisions made however this is not always possible. In this case, the reasoning has been listed in the section that follows.

4.2.1 Item

There were no major assumptions made for the items. We followed the feedback received from the previous project and used the associative entity of ReceiptItem to satisfy requirements of sale price and quantity.

4.2.2 ReceiptItem

As suggested above, the ReceiptItem table was created to satisfy feedback received on our previous project , allows for quantity and price association.

4.2.3 Receipt

The receipt had no changes in comparison to the previous analysis, the changes occured in related entities and did not affect the receipt table.

4.2.4 Staff

Staff were left untouched, the relation to location however did play a large role in this analysis, and a major assumption of a staff member only being at one location at a time or being directly related only to the one location was made.
This assumption normally would not be made, but assurances of data cleanliness were made, and the C# script did not find any discrepencies between our assumption and the supplied information.

4.2.5 Customer

We made assumptions that customers are likely to shop at only the one store. Given the geographic distances between stores generally being larger than we deemed most people would be likely to travel.

4.2.6 Office

Our analysis assumed future office potential growth to be related to the locality of the store. Such an assumption may suggest that we weighed in favour of stores in high population areas if the analysis was borderline for example: Newcastle and Broken Hill; Newcastle would be favoured as the growth potential was assumed to be greater and more predictable into the future.

5 Base Analysis

5.1 Notes on Analysis

Analysis was performed using Microsoft SQL Management Studio, with a flat file of the original data being imported into the table as defined here, as with the previous assignment utilisation of decimal(18.7) was our choice over using the money type, again citing the imprecision of money in MSSQL/TSQL [1]

Source files to immitate the analysis below is either included inline or in sources files in the final submission.

5.2 Raw Results

5.2.1 Total Number of Sales

The total number of sales per staff member were considered with the following sql query:

```
SELECT COUNT(*) AS 'Sales Count'
                , s.StaffId
                , s.StaffFirstName
                , s.StaffSurname
                , o.OfficeId
                , o.OfficeLocation
FROM Receipt r
        INNER JOIN ReceiptItem ri
                                ON r.ReceiptId = ri.ReceiptId
        INNER JOIN Item i
                                ON i.ItemId = ri.ItemId
        INNER JOIN Staff s
                                ON s.StaffId = r.ReceiptStaffId
        INNER JOIN Office o
                                ON o.OfficeId = s.StaffOfficeId
GROUP BY s.StaffId
                , s.StaffFirstName
                , s.StaffSurname
                , o.OfficeId
                , o.OfficeLocation
ORDER BY 'Sales Count' DESC;
```

Sales Count	StaffId	StaffFirstName	StaffSurname	OfficeId	OfficeLocation
720	S190	Samuel	Anderson	4	Sydney
688	S122	Austin	Morris	6	Grafton
678	S196	Devin	Brown	6	Grafton
666	S45	Emma	Gutierrez	3	Cessnock
658	S101	Jenna	Cox	5	Port Macquarie

5.2.2 Total Items Sold

The total items attributed to each staff member were considered also, determined by the query:

```
SELECT SUM(ri.ReceiptItemQuantity) AS 'Item Count'
                , s.StaffId
                , s.StaffFirstName
                , s.StaffSurname
                , o.OfficeId
                , o.OfficeLocation
FROM Receipt r
        INNER JOIN ReceiptItem ri
                                        ON r.ReceiptId = ri.ReceiptId
        INNER JOIN Staff s
                                        ON s.StaffId = r.ReceiptStaffId
        INNER JOIN Office o
```

```
                                        ON o.OfficeId = s.StaffOfficeId
GROUP BY s.StaffId
                , s.StaffFirstName
                , s.StaffSurname
                , o.OfficeId
                , o.OfficeLocation
ORDER BY 'Item Count' DESC;
```

Item Count	StaffId	StaffFirstName	StaffSurname	OfficeId	OfficeLocation
3978	S190	Samuel	Anderson	4	Sydney
3787	S122	Austin	Morris	6	Grafton
3683	S45	Emma	Gutierrez	3	Cessnock
3679	S101	Jenna	Cox	5	Port Macquarie
3628	S106	Mia	Foster	9	Wagga Wagga

5.2.3 Discounted Sales Ratio

Consideration of the number of sales made by each staff member was also made, the following query yielding the results we required:

```
SELECT s.StaffId
                , s.StaffFirstName
                , s.StaffSurname
                , o.OfficeId
                , o.OfficeLocation
                , SUM(SubQuery.[Discounted Sales]) AS 'Discounted Sales'
                , SUM(SubQuery.[Standard Sales]) AS 'Standard Sales'
FROM (
        SELECT CAST(
                CASE
                WHEN COUNT(ri.[ReceiptItemQuantity]) >= 5
                        THEN 1
                ELSE 0
                END AS INT) AS 'Discounted Sales',
        CAST(
                CASE
                WHEN COUNT(ri.[ReceiptItemQuantity]) >= 5
                        THEN 0
                ELSE 1
        END AS INT) AS 'Standard Sales',
        r.ReceiptId
        FROM Receipt r
                INNER JOIN ReceiptItem ri
                                        ON r.ReceiptId = ri.ReceiptId
                INNER JOIN Item i
                                        ON i.ItemId = ri.ItemId
        GROUP BY r.ReceiptId
) AS SubQuery
        INNER JOIN Receipt r
                                ON SubQuery.ReceiptId = r.ReceiptId
        INNER JOIN ReceiptItem ri
                                ON r.ReceiptId = ri.ReceiptId
        INNER JOIN Staff s
                                ON s.StaffId = r.ReceiptStaffId
        INNER JOIN Office o
                                ON o.OfficeId = s.StaffOfficeId
GROUP BY s.StaffId
                , s.StaffFirstName
                , s.StaffSurname
```

```
                , o.OfficeId
                , o.OfficeLocation
ORDER BY [Discounted Sales];
```

StaffId	StaffFirstName	StaffSurname	OfficeId	OfficeLocation	Discounted Sales	Standard Sales

5.4 Total Number of Customers

Sales Count	StaffId	StaffFirstName	StaffSurname

5.5 Top Team-member(s) Analysis

Analysis over all stores, correlation to store we want to nuke?

Sales Count	StaffId	StaffFirstName	StaffSurname

5.6 Customer Analysis

Analysis per store - top 3?

Sales Count	StaffId	StaffFirstName	StaffSurname

5.6.1 Customer Frequency

Can we predict future trends in customers?

Sales Count	StaffId	StaffFirstName	StaffSurname

5.7 Items Per Sale

Sales Count	StaffId	StaffFirstName	StaffSurname

5.8 Item Popularity

Top 3 best and worst items overall, correlation to any stores?

Sales Count	StaffId	StaffFirstName	StaffSurname

5.9 Worst Performing Item

Correlation to store?

Sales Count	StaffId	StaffFirstName	StaffSurname
